

	<h2>ENG in Central Vertigo</h2>

	<h2>ENG findings in Central Vertigo</h2>
	<ul style="list-style-type: none"> <li>■ Spontaneous and Fixation</li> <li>■ Gaze evoked and Rebound</li> <li>■ Pursuit</li> <li>■ Saccades <ul style="list-style-type: none"> <li>– INO, Slow</li> <li>– Dysmetria</li> <li>– Opsoclonus</li> </ul> </li> <li>■ Central Positional Nystagmus</li> </ul>

	<h2>ENG: Spontaneous: Pendular</h2>
<ul style="list-style-type: none"> <li>■ Spontaneous</li> <li>■ Fixation</li> </ul>	 <p>Patient with oculopalatal myoclonus. MS and CN other reasonable possibilities.</p> 

	<h2>ENG: Spontaneous: PAN</h2>
<ul style="list-style-type: none"> <li>■ Spontaneous</li> <li>■ Fixation</li> </ul>	 <p>Congenital and acquired forms. Acquired form usually from cerebellar nodulus lesion. Usual period is 200 sec. Easily missed on ENG which can cause great confusion.</p>

	<h2>Spontaneous up, dn or torsional is usually central</h2>
<ul style="list-style-type: none"> <li>■ Spontaneous</li> <li>■ Fixation</li> </ul>	<ul style="list-style-type: none"> <li>■ Can't record torsion nystagmus, but it is always central if present upright.</li> <li>■ Small degrees of ubn or dbn are usually innocuous</li> </ul>

	<h2>Fixation suppression: Peripheral</h2>
<ul style="list-style-type: none"> <li>■ Spontaneous</li> <li>■ Fixation</li> </ul>	<p>Good fixation suppression of caloric</p>  <p>Patient is trying (excursion goes down) but it isn't working.</p> 

## Fixation suppression – other comments

- There are many pitfalls to caloric fixation – rotatory chair is more reliable. This greatly limits it's utility.
  - Choice of place in caloric to fixate
  - How hard is patient trying ?
  - Choice of place in trace to analyze

## Fixation suppression

- Spontaneous
- Fixation
  - Good or bad in central vertigo – just depends what brain structure is affected. Bad suggests central. Good doesn't help.
  - There are many pitfalls to “Bad” caloric fixation. This greatly limits it's utility.
    - Choice of place in caloric to fixate
    - How hard is patient trying ?
    - Choice of place in trace to analyze

## Fixation suppression: CN

- Spontaneous
- Fixation
  - Fixation increases nystagmus in most CN

## ENG – Gaze -- GEN

- Gaze evoked
- Rebound
  - You can usually see GEN on saccade test. GEN is most commonly due to medication (such as anticonvulsants). Also sedatives. There is no rebound in drug induced GEN
  - Occasionally GEN is due to cerebellar disorders.

## ENG – Gaze -- CN

- Gaze evoked
- Rebound
  - CN typically has strong GEN, but usually it is asymmetrical with a “null” off-center.

## ENG – Gaze -- Rebound

- Gaze evoked
- Rebound
  - Rebound is easily seen on ENG. You may have to configure a special protocol however. Rebound is specific for central disorders.

# ENG: Central Pursuit

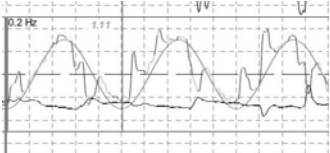

- Poor Pursuit
- Not trying
- Can't see
- CN

- Poor pursuit – drugs, central
- Not trying
- Blind people don't pursue very well
- CN pursuit: Too fast pursuit with “backup” saccades – typical of Latent Nystagmus and other types of CN.

# ENG: Cerebellar pursuit

- Poor Pursuit
- Not trying
- Can't see
- CN

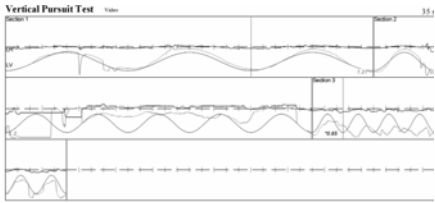

- Poor pursuit – drugs, central

# ENG: Central Pursuit

- Poor Pursuit
- Not trying
- Can't see
- CN

- Not trying (malingering below)

# ENG: Central Pursuit

- Poor Pursuit
- Not trying
- Can't see
- CN

- Blind people don't pursue very well if at all.
  - Removed spectacles
  - Cataracts
  - Glaucoma
  - Macular Degeneration

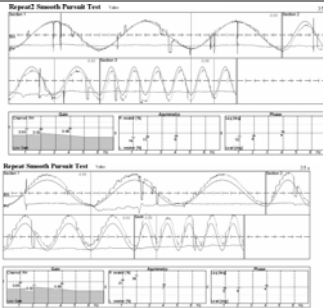

# ENG: Central Pursuit:CN

- Poor Pursuit
- Not trying
- Can't see
- CN

Asymmetrical pursuit in LN.

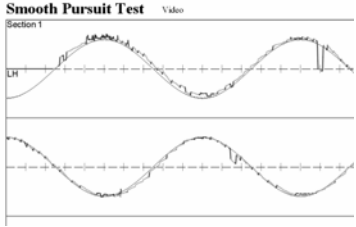

Changes direction according to viewing eye.

# ENG: Central Pursuit:CN

- CN

Backup saccades in LN

	<b>ENG: Saccades</b>
	<ul style="list-style-type: none"> <li>■ INO or BINO</li> <li>■ Slow</li> <li>■ Dysmetric</li> <li>■ Opsoclonus</li> </ul>

	<b>INO – patient with MS</b>
<ul style="list-style-type: none"> <li>■ INO or BINO</li> <li>■ Slow</li> <li>■ Dysmetric</li> <li>■ Opsoclonus</li> </ul>	

	<b>Slow saccades</b>
<ul style="list-style-type: none"> <li>■ INO or BINO</li> <li>■ Slow</li> <li>■ Dysmetric</li> <li>■ Opsoclonus</li> </ul>	<p>Slow vertical saccades are usually due to PSP or calibration error. You can easily tell the difference by checking to see if the eye is tracking the target.</p>

	<b>Dysmetric Saccades – patient with cerebellar degeneration</b>
<ul style="list-style-type: none"> <li>■ INO or BINO</li> <li>■ Slow</li> <li>■ Dysmetric</li> <li>■ Opsoclonus</li> </ul>	

	<b>Opsoclonus – patient with post-infectious syndrome</b>
<ul style="list-style-type: none"> <li>■ INO or BINO</li> <li>■ Dysmetric</li> <li>■ Opsoclonus</li> </ul>	<ul style="list-style-type: none"> <li>■ Opsoclonus can't be seen on VENG</li> <li>■ Blink algorithms cut it out</li> <li>■ It is an "eyeball" diagnosis.</li> </ul>

	<b>ENG: central: positional</b>
	<ul style="list-style-type: none"> <li>■ It's not BPPV – no burst of UB/Torsion or lateral canal pattern</li> <li>■ Never stops</li> <li>■ Unusual vectors – <ul style="list-style-type: none"> <li>– Purely vertical</li> <li>– Purely horizontal</li> <li>– Purely torsional</li> </ul> </li> </ul>

	<b>Central Positional</b>
	<ul style="list-style-type: none"> <li>■ Be cautious in calling a central positional</li> <li>■ Most positional nystagmus, no matter how bizarre it is, is BPPV</li> <li>■ If there are several strong central findings, maybe.</li> </ul>

	<b>Summary – this is the hard part to ENG interpretation</b>
	<ul style="list-style-type: none"> <li>■ Central vertigo is uncommon but very complex, and often a dangerous problem.</li> <li>■ Nearly any neurological condition may cause central vertigo</li> <li>■ ENG interpretation of central vertigo is very complex.</li> </ul>
